

Clip On Handlebar Alignment Tool

Getting the angle correct on clip on handlebars can be a real hassle. It's very difficult to get the angle the same from side to side. Comparing reference points on the triple clamp can get you close, measuring from each end of the bar to the frame can be close, but for those of us who are very picky about the ergonomics of our motorcycles, none of these methods are good enough. The Motion Pro Clip-On Handlebar Alignment Tool is the solution you need, guaranteed to get them exactly the same every time an adjustment is necessary. The tool works by using the fork centers as a benchmark, and allows you to set the tool to one side, and then quickly and easily transfer that measurement to the other side to within tenths of a millimeter. This process is quick and repeatable, ensuring you will have your handlebars exactly where you want them every time.

Accept no compromises, choose only quality motorcycle tools.
