

## Frequently Asked Questions

### **What's the difference in hub piloted and stud piloted wheels?**

Hub piloted wheels are "centered" or located into the proper location by the hub of the vehicle. The lug nuts on this type of application are usually black with a flat "swivel" washer on the bottom end.

Stud piloted wheels are "centered" or located into the proper location by the lug nuts. The lug nuts are usually tapered on one end and flat on the opposite end. These wheels are sometimes referred to as "Ball Seat" wheels.

### **How do I find a wheel number on my vehicle?**

To find a wheel # on most 19.5" & larger steel wheels look on the front wheel in between the lug nuts for an Accuride wheel that will usually be a 5-digit number beginning with a 2 or 5, example 28408 or 50180. If it is a Topy wheel it usually is 5 or 6-digit number with a letter, example 127-09T or 139-10TC.
