

IMPORTANT: BEFORE RIDING THE MOTORCYCLE IT'S OBLIGATORY MAKE THIS REGULATION

Perch part# 9688N with regulation on brake feeling.

Note: Motoplastic recommends this operation to be handled by a mechanic specialist.

Adjusting process:

1. Lift the front wheel and make it turn to verify it does not get braked.
2. Through the regulation on screw 1, the point of brake entry can be adjusted (tightening the screw the brake entry will be advanced; loosening it, the brake entry is delayed). It is very important to leave a security margin to avoid pads under pression ending up with locked brakes. To ensure this security margin is given, a gauge can be placed (a paper fold up several times could be used) on the limit of bracket A and ensure that the wheel does not get locked.
3. Once adjusted, tighten the screw "2".
