

# Brake Light Switch

DESCRIPTION	PART #
10mm x 1.25 thread pitch	RS100
10mm x 1.00 thread pitch	RS200

**Sold Separately**

**Retain the functionality of your brake light with the in-line pressure switch. The switch screws into the master cylinder to activate the rear light using hydraulic pressure.**

**Warning: Use caution when installing in-line pressure switches on motorcycle models where the brake line fittings are on the inside of the master cylinder. The added length of the switch and wire assembly may result in a clearance issue with the swingarm. Always check for clearance over the entire range of suspension movement to ensure no contact will occur. NEVER modify the rearset or brake system and NEVER use spacers to increase clearance.**

**Since Vortex rearsets are designed for racing use we cannot guarantee that in-line pressure switches can be installed on all models or applications.**

**Looking for dependable motorcycle electrical parts? Rely on Vortex for quality and long-lasting products.**
